Software design is the process of converting users' needs into a suitable form, which helps the programmer in software coding and implementation.

Different Types Of Software Design Levels:-

In the software engineering field software designing is a main section. We can categorized into three sections of the software designing these are as--

- Architectural Design

- High-level Design

- Detailed Design

Simply *Software Design* is the process of defining software methods, functions, objects, and the overall structure and interaction of your code so that the resulting functionality will satisfy your users requirements. *Oriented Analysis Design* techniques in particular, seem to be taking the software world by storm.

This is a great approach to design software.

It makes things simple and intuitive both for the designer and the user.
